

Project Title: Bulletproof Team Management Calendar Application
Team: Dan Wood, Tristan Kells, Junha Yu

We have developed a high-level, web-based team management application for Bulletproof, a cloud consulting company based in Auckland. The project was pitched as a replacement for a physical whiteboard system, where teams can keep track of assigned clients for the week. The project is adaptable for companies utilising a similar workflow.

Our application provides unique visual insight into team management with an intuitive layout. By removing the clutter of modern calendar platforms, our application serves a market that needs a simple way to organise consultant and client relationships. Features include an encrypted login with support for Google SSO, customisable client and consultant details, editable weekly calendar and a monthly summary. The application was built using a LAMP (Linux, Apache, MySQL and PHP) development stack and the jQuery javascript library. It is deployed to an AWS cloud server with the expertise and resources of the Bulletproof team.

Ultimately this application fosters collaboration and open communication between team members and management. It increases the transparency of projects and enables users to meet deadlines and improve productivity.
